BEAM PENTODE

FOR TV HORIZONTAL-DEFLECTION AMPLIFIER APPLICATIONS

DESCRIPTION AND RATING

The 6AV5-GA is a beam pentode designed primarily for use as the horizontal-deflection amplifier in television receivers. The tube exhibits high perveance, high plate current at low plate and screen voltages, and a high ratio of plate to screen current.

Except for heater ratings, the 12AV5-GA, 17AV5-GA, and 25AV5-GA are identical to the 6AV5-GA. In addition, the 12AV5-GA and 17AV5-GA, which feature a controlled heater warm-up characteristic, are especially suited for use in television receivers with series-connected heaters.

* The time required for the voltage across the heater to reach 80 percent of its rated value after applying 4 times rated heater voltage to a circuit consisting of the tube heater in series with a resistance equal to 3 times the rated heater voltage divided by the rated heater current.

† Without external shield.

‡ For operation in a 525-line, 30-frame television system as described in "Standards of Good Engineering Practice Concerning Television Broadcast Stations," Federal Communications Commission. The duty cycle of the voltage pulse must not exceed 15 percent of one scanning cycle.

§ Value given is to be considered as an Absolute Maximum Rating. In this case, the combined effect of supply voltage variation, manufacturing variation including components in the equipment, and adjustment of equipment controls should not cause the rated value to be exceeded.

△In stages operating with grid-leak bias, an adequate cathode-bias resistor or other suitable means is required to protect the tube in the absence of excitation.

◆ Applied for short interval (two seconds maximum) so as not to damage tube.

**Triode connection (screen tied to plate) with Eb = Ec2 = 150 volts and Ec1 = −22.5 volts.
